**Supplemental Fig. S1.** Fibrosis area of tibialis anterior muscle in Masson’s trichrome staining. Graphs showing percentage of blue-stained fibrosis area of tibialis anterior muscle using Masson’s trichrome staining (*n*=5 per each group). Results are presented as mean±standard error of the mean. Treatment groups were as follows: control=oral distilled water and intraperitoneal (IP) phosphate buffered saline (PBS); dexamethasone (Dex)=oral Dex (1 mg/kg) and IP PBS; Dex+delta-like 1 homolog (DLK1)=oral Dex (1 mg/kg) and IP DLK1 (0.8 mg/kg/day). NS, non-significant. *P*<0.05 was considered statistically significant.
